3.2.3 Shape/geometry and dimensional accuracy ..... 21
4 Plastic containers (without PET) ..... 26
4.1 Rotationally symmetrical, cylindrical containers ..... 26
4.1.1 Sample drawing - Example 1 ..... 26
4.1.2 Sample drawing - Example 2 ..... 27
4.1.3 Shape/geometry and dimensional accuracy ..... 27
4.2 Not rotationally symmetrical containers (specially-shaped containers) ..... 29
4.2.1 Overview matrix ..... 29
4.2.2 Sample drawing - Example 1 ..... 30
4.2.3 Sample drawing - Example 2 ..... 31
4.2.4 Shape/geometry and dimensional accuracy ..... 31
5 Cans ..... 33
5.1 Rotationally symmetrical, cylindrical containers ..... 33
5.1.1 Sample drawing - Example 1a closed beverage containers ..... 33
5.1.2 Sample drawing - Example 1b open beverage containers ..... 34
5.1.3 Sample drawing - Example 2a closed food can ..... 35
5.1.4 Sample drawing - Example 2b closed food can ..... 36
5.1.5 Sample drawing - Example 3: Other cans ..... 37
5.1.6 Shape/geometry and dimensional accuracy ..... 37
6 Spotting bar geometry ..... 40
6.1 Side-spotting bars ..... 40
6.1.1 Recessed side-spotting bar ..... 40
6.1.2 Raised side-spotting bar ..... 40
6.2 Base spotting bars for glass containers ..... 41
6.3 Base spotting bars for plastic containers ..... 42

## 1 General information

### 1.1 Basic information

"This is to specify the demands the filling and packing line places on the container. It does not replace any other specifications. In particular the KRONES PET non-returnable container specification, which specifies the container properties of containers produced on KRONES Contiform machines is not replaced by the specification.

The indicated dimensions and tolerances are the minimum requirements necessary for the configuration of the different machines. Deviations of this specification must be reported in advance to the special field departments.
This concerns the following parameters:

- Shape/geometry and dimensional accuracy
- Physical properties
- Neck geometry/neck finish

The specification is valid for the following container types:

- Glass containers:
rotationally symmetrical, cylindrical containers and specially-shaped bottles
- PET containers:
rotationally symmetrical, cylindrical containers and specially-shaped bottles
- Plastic containers:
rotationally symmetrical, cylindrical containers and specially-shaped bottles
- Cans

The specification is to be understood as a supplement and as a clarification of a container drawing.
This specification does not replace the customer's container drawing!
If the weight, tolerances and other requirements of the specification are exceeded, please consult with KRONES!

Parts that depend on the containers can only be designed with the original sample material. The sample must be provided by the customer. This is especially the case when there are different container suppliers (one sample material each is to be provided per supplier).

### 1.2 Tilting angle of containers

The tilting angle must be indicated with $k$ for all containers. It is defined by the centre of gravity $S$ and the floor space radius (= footprint diameter SD/2) of the container.

## $\rightarrow$ See the following drawings (apply as reference for all container types)

The tilt angle $k$ of the containers must be at least $10^{\circ}$.

General information

$S$ = centre of gravity
$\mathrm{K}=$ tilt angle
$\varnothing$ SD = footprint diameter

Fig. 1: Example: PET container, beverage can

## 2 Glass containers

### 2.1 Rotationally symmetrical, cylindrical containers

### 2.1.1 Sample drawing - example

Fig. 2: Dimensioned glass bottle
// = plane parallelism
$\varnothing \mathrm{DM}=$ neck finish diameter
$\varnothing$ L1 = neck diameter, beginning
$\varnothing$ L2 = neck diameter, end
$\varnothing \mathrm{D}=$ container diameter
$H=$ container height
$\mathrm{E}=$ height of neck area
$C=$ height of neck area, end
$E=$ height of emblem
$B=$ height of labelling area
A = height of labelling area, end
$\perp$ = perpendicularity
/o/ = cylindrical shape
$\beta=$ inclination
a = spotting bar position
$\cap$ = line shape
NG = spotting bar geometry after separate drawing

### 2.1.2 Shape/geometry and dimensional accuracy

Dimensional drawing based on DIN 6129-1 (all dimensions in mm)
Heights

| Total height H |  | Permissible deviation [mm] | Total height H |  | Permissible deviation [mm] |
| :---: | :---: | :---: | :---: | :---: | :---: |
| above | to: |  | above | to: |  |
| - | 50 | $\pm 0.8$ | 250 | 300 | $\pm 1.8$ |
| 50 | 75 | $\pm 0.9$ | 300 | 325 | $\pm 1.9$ |
| 75 | 100 | $\pm 1.0$ | 325 | 350 | $\pm 2.0$ |
| 100 | 125 | $\pm 1.1$ | 350 | 375 | $\pm 2.1$ |
| 125 | 150 | $\pm 1.2$ | 375 | 400 | $\pm 2.2$ |
| 150 | 175 | $\pm 1.3$ | 400 | 425 | $\pm 2.3$ |
| 175 | 200 | $\pm 1.4$ | 425 | 450 | $\pm 2.4$ |
| 200 | 225 | $\pm 1.5$ | 450 | 475 | $\pm 2.5$ |
| 225 | 250 | $\pm 1.6$ | 475 | 500 | $\pm 2.6$ |

## Glass containers

Calculation of the permissible deviation [mm] for $\mathrm{H}: \pm(0.6+0.004 \times \mathrm{H})$; values are always rounded up to a full 0.1 mm .

## Container diameter

| Container diameter D | Permissible |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| above | do: | Container diameter D |  | Permissible |
| deviation [mm] |  |  |  |  |

Calculation of the permissible deviation [mm] for $D: \pm(0.5+0.012 \times D)$; values are always rounded up to a full 0.1 mm . With oval and square cross-sections, the wide side of the cross-sectional dimension is used for the definition.

## Neck geometry

For designing the neck guide, the beginning of the neck (dimension C ) and the neck height (dimension $\mathrm{E})$ are required.

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :--- | :--- |
| Neck-diameters - beginning | $Ø$ L1 | $\pm 0.2$ |
| Neck-diameters - end | $\emptyset$ L2 | $\pm 0.2$ |

With deep-cone wrap-around labels, the maximum deviation from the conicity must not exceed $0.1^{\circ}$.

## Spotting bar position

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :--- | :--- |
| Spotting bar position relative to emblem | a | $\pm 0.1^{\circ}$ |

## Emblem

A maximum overhang of the emblems of $<0.75 \mathrm{~mm}$ in the diameter is permissible in the shoulder area. This applies to emblems on the front and rear side.

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :--- | :--- |
| Emblem inclination | $\beta$ | $\pm 0.3^{\circ}$ |

## Plane parallelism

Please note "Plane parallelism" in Chap. 2.1.1 Sample drawing - example [» 6]

| Neck finish diameter DM |  | Permissible deviation [mm] |
| :--- | :--- | :--- |
| above | to: |  |
| - | 40 | $2 \%$ of diameter |
| 40 | 60 | 0.9 |
| 60 | - | 1.0 |

## Rectangularity

Please note "Rectangularity" in Chap. 2.1.1 Sample drawing - example [> 6]

|  | Total height H |  |
| :--- | :--- | :--- |
| above | to: | Permissible axis deviation of |
| 0 | 120 | $\pm 0.8$ |
| 120 | 140 | $\pm 0.9$ |
| 140 | 160 | $\pm 1.0$ |
| 160 | 180 | $\pm 1.1$ |
| 180 | 200 | $\pm 1.2$ |
| 200 | 220 | $\pm 1.3$ |
| 220 | 240 | $\pm 1.4$ |
| 240 | 260 | $\pm 1.5$ |
| 260 | 280 | $\pm 1.6$ |
| 280 | 300 | $\pm 1.7$ |
| 300 | 320 | $\pm 1.8$ |
| 320 | 340 | $\pm 1.9$ |
| 340 | 360 | $\pm 2.0$ |
| 360 | 380 | $\pm 2.1$ |
| 380 | 400 | $\pm 2.2$ |
| 400 | 420 | $\pm 2.3$ |
| 420 | 440 | $\pm 2.4$ |
| 440 | 460 | $\pm 2.5$ |
| 460 | 480 | $\pm 2.7$ |
| 480 | 500 |  |

## Calculation formula for axis deviation:

H greater than 120: $(0.3+0.01 \times \mathrm{H}) \times 0.5$; values are always rounded up to a full 0.1 mm . (Container height H includes the neck finish, see 2.1.1 Sample drawing - example [ 6])

## Cylindrical shape/linear shape

In the labelling area, the cylindrical shape must not deviate from the nominal dimension of the container by more than 0.3 mm .

## Additional requirements

With base heights A greater than 30 mm , the radius RB must be indicated.

With conical base contours and base heights A > 30 mm must be dimensioned at half the base height ( $A / 2$ ) of the angle $y^{\circ}$.

Fig. 3: Dimensioned base contour

## Surface and surface condition

For coated glass containers or diffuse surfaces (also embossing or debossing in the glass), this note is required for performing possible tests. In addition, the colour of the container is relevant as a design criterion.

## Neck finishes

The shape and tolerances of the neck finishes are standardised acc. to DIN 6094. Deviations from this standard must be specified separately.

If customer-specific neck finishes are used, enclose the appropriate drawings.

## Base geometry

For containers with base and/or side-spotting bars (raised/recessed) (also embossing or debossing in the base area), they must be separately dimensioned and specified with the corresponding tolerances (see Chap. 6 Spotting bar geometry [ 40]).

## Other requirements

With tamper-evident labels, the Labelling Technology Division must be consulted for dimensions $E+$ height of neck finish $M<40 \mathrm{~mm}$. The KRONES specialist department must be consulted if the label protection is missing. Damage to the label must be expected if the label protection is missing.

### 2.2 Not rotationally symmetrical containers (speciallyshaped containers)

### 2.2.1 Sample drawing - example

Fig. 4: Dimensioned glass bottle (specially-shaped container)
// = plane parallelism
$\varnothing$ DM = neck finish diameter
$\varnothing$ L1 = neck diameter, beginning
$\varnothing L 2$ = neck diameter, end
$\varnothing$ L1 - L5 = relevant neck diameter
Rh = relevant neck radius
G, J, E = relevant neck height dimension
$\varnothing \mathrm{D}=$ container diameter
$\mathrm{N}=$ inside container diameter
$\mathrm{H}=$ container height
C = height of neck area, end
$E=$ height of emblem
$B=$ height of labelling area
A = height of labelling area, end
_ = straightness
$\perp$ = perpendicularity
$\beta=$ inclination
a = spotting bar position
$\cap$ = line shape
NG = spotting bar geometry after separate drawing

### 2.2.2 Overview matrix

The following overview shows the various specially-shaped containers schematically:

Fig. 5: Container shape - square

Fig. 8: Container shape - circular

Fig. 11: Container shape - polygonal

Fig. 9: Container shape - hexagonal

Fig. 12: Container shape - oval

Fig. 10: Container shape - octagonal

Fig. 13: Container shape - kidneyshaped

Fig. 14: Special shape and Others

### 2.2.3 Shape/geometry and dimensional accuracy

Dimensional drawing based on DIN 6129-1 (all dimensions in mm)

## Heights

| Total height H |  | Permissible deviation [mm] | Total height H |  | Permissible deviation [mm] |
| :---: | :---: | :---: | :---: | :---: | :---: |
| above | to: |  | above | to: |  |
| - | 50 | $\pm 0.8$ | 250 | 300 | $\pm 1.8$ |
| 50 | 75 | $\pm 0.9$ | 300 | 325 | $\pm 1.9$ |
| 75 | 100 | $\pm 1.0$ | 325 | 350 | $\pm 2.0$ |
| 100 | 125 | $\pm 1.1$ | 350 | 375 | $\pm 2.1$ |
| 125 | 150 | $\pm 1.2$ | 375 | 400 | $\pm 2.2$ |
| 150 | 175 | $\pm 1.3$ | 400 | 425 | $\pm 2.3$ |
| 175 | 200 | $\pm 1.4$ | 425 | 450 | $\pm 2.4$ |
| 200 | 225 | $\pm 1.5$ | 450 | 475 | $\pm 2.5$ |
| 225 | 250 | $\pm 1.6$ | 475 | 500 | $\pm 2.6$ |

## Glass containers

Calculation of the permissible deviation [mm] for $\mathrm{H}: \pm(0.6+0.004 \times \mathrm{H})$; values are always rounded up to 0.1 mm .

## Container diameter

| Container diameter D <br> Inside container diameter $\mathbf{N}$ |  | Permissible deviation [mm] | Container diameter D <br> Inside container diameter N |  | Permissible deviation [mm] |
| :---: | :---: | :---: | :---: | :---: | :---: |
| above | to: |  | above | to: |  |
| - | 25 | $\pm 0.8$ | 100 | 108 | $\pm 1.8$ |
| 25 | 33 | $\pm 0.9$ | 108 | 116.5 | $\pm 1.9$ |
| 33 | 41.5 | $\pm 1.0$ | 116.5 | 125 | $\pm 2.0$ |
| 41.5 | 50 | $\pm 1.1$ | 125 | 133 | $\pm 2.1$ |
| 50 | 58 | $\pm 1.2$ | 133 | 141.5 | $\pm 2.2$ |
| 58 | 66.5 | $\pm 1.3$ | 141.5 | 150 | $\pm 2.3$ |
| 66.5 | 75 | $\pm 1.4$ | 150 | 158 | $\pm 2.4$ |
| 75 | 83 | $\pm 1.5$ | 158 | 166.5 | $\pm 2.5$ |
| 83 | 91.5 | $\pm 1.6$ | 166.5 | 175 | $\pm 2.6$ |
| 91.5 | 100 | $\pm 1.7$ | 175 | 183 | $\pm 2.7$ |

Calculation of the permissible deviation [mm] for $D: \pm(0.5+0.012 x D)$; values are always rounded up to a full 0.1 mm . With oval and square cross-sections, the wide side of the cross-section is used for defining the dimension limits.

## Neck geometry

For designing the neck guide, the beginning of the neck (dimension C ) and the neck height (dimension E) are required.

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :--- | :--- |
| Neck-diameters - beginning | $Ø$ L1 | $\pm 0.3$ |
| Neck-diameters - end | $Ø$ L2 | $\pm 0.3$ |

With deep-cone wrap-around labels, the maximum deviation from the conicity must not exceed $0.1^{\circ}$.

## Spotting bar position

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :--- | :--- |
| Spotting bar position relative to emblem | a | $\pm 0.1^{\circ}$ |

## Emblem

A maximum overhang of the emblems of $<0.75 \mathrm{~mm}$ in the diameter is permissible in the shoulder area. This applies to emblems on the front and rear side.

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :--- | :--- |
| Emblem inclination | $\beta$ | $\pm 0.3^{\circ}$ |

## Plane parallelism

Please note "Plane parallelism" in Chap. 2.2.1 Sample drawing - example [ 10]

| Neck finish diameter DM |  | Permissible deviation [mm] |
| :--- | :--- | :--- |
| above | to: |  |
| - | 40 | $2 \%$ of diameter |

| Neck finish diameter DM |  | Permissible deviation [mm] |
| :--- | :--- | :--- |
| above | to: |  |
| 40 | 60 | 0.9 |
| 60 | - | 1.0 |

## Rectangularity

Please note "Rectangularity" in Chap. 2.2.1 Sample drawing - example [» 10]

| Total height H |  | Permissible axis deviation of rectangularity [mm] |
| :---: | :---: | :---: |
| above | to: |  |
| 0 | 120 | $\pm 0.8$ |
| 120 | 140 | $\pm 0.9$ |
| 140 | 160 | $\pm 1.0$ |
| 160 | 180 | $\pm 1.1$ |
| 180 | 200 | $\pm 1.2$ |
| 200 | 220 | $\pm 1.3$ |
| 220 | 240 | $\pm 1.4$ |
| 240 | 260 | $\pm 1.5$ |
| 260 | 280 | $\pm 1.6$ |
| 280 | 300 | $\pm 1.7$ |
| 300 | 320 | $\pm 1.8$ |
| 320 | 340 | $\pm 1.9$ |
| 340 | 360 | $\pm 2.0$ |
| 360 | 380 | $\pm 2.1$ |
| 380 | 400 | $\pm 2.2$ |
| 400 | 420 | $\pm 2.3$ |
| 420 | 440 | $\pm 2.4$ |
| 440 | 460 | $\pm 2.5$ |
| 460 | 480 | $\pm 2.6$ |
| 480 | 500 | $\pm 2.7$ |

## Calculation formula for axis deviation:

H greater than 120: $(0.3+0.01 \times \mathrm{H}) \times 0.5$; values are always rounded up to a full 0.1 mm . (Container height H includes the neck finish, see 2.2.1 Sample drawing - example [ $>10$ ])

## Straightness/linear shape

In the labelling area, both the straightness and the linear shape must not deviate from the ideal state of the container by more than 0.3 mm .

## Additional requirements

Fig. 15: Dimensioned base contour

With base heights A greater than 30 mm , the radius RB must be indicated.

With conical base contours and base heights A > 30 mm must be dimensioned at half the base height ( $A / 2$ ) of the angle $y^{\circ}$.

## Surface and surface condition

For coated glass containers or diffuse surfaces (also embossing or debossing in the glass), this note is required for performing possible tests. In addition, the colour of the container is relevant as a design criterion.

## Base geometry

For containers with base and/or side-spotting bars (raised/recessed) (also embossing or debossing in the base area), they must be separately dimensioned and specified with the corresponding tolerances (see Chap. 6 Spotting bar geometry [ 40]).

## Other requirements

With curved geometries (see neck geometry in Chap. 2.2.1 Sample drawing - example [> 10]), the dimensions must be specified so that the outer geometry is completely determined (reproducibility of the geometry).

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :--- | :--- |
| Neck geometry | $\emptyset$ L1 | $\pm 0.3$ |
|  | $\emptyset$ L2 | $\pm 0.3$ |
|  | $\emptyset$ L3 | $\pm 0.3$ |
|  | $\pm 0.3$ |  |
|  | $\emptyset$ L5 | $\pm 0.3$ |

With tamper-evident labels, the Labelling Technology Division must be consulted for dimensions $E+$ height of neck finish $M<40 \mathrm{~mm}$. The KRONES specialist department must be consulted if the label protection is missing. Damage to the label must be expected if the label protection is missing.

## $3 \quad$ PET containers

### 3.1 Rotationally symmetrical, cylindrical containers

### 3.1.1 Sample drawing - example

Fig. 16: Dimensioned PET container
/= plane parallelism
$\varnothing \mathrm{DM}=$ neck finish diameter
$\varnothing$ L1 = neck diameter, beginning
$\varnothing$ L2 $=$ neck diameter, end
$\varnothing \mathrm{D}=$ container diameter
$\mathrm{H}=$ container height
$\mathrm{E}=$ height of neck area
C = height of neck area, end
$\mathrm{E}=$ height of emblem
$B=$ height of labelling area
A = height of labelling area, end
$\perp$ = perpendicularity
/o/ = cylindrical shape
$\beta=$ inclination
$\alpha=$ spotting bar position
$\cap=$ line shape
NG = spotting bar geometry after separate drawing

### 3.1.2 Shape/geometry and dimensional accuracy

Heights, containers and label diameter

| Rated volume [l] |  | Height $(\mathrm{H})[\mathrm{mm}]$ |  | Container diameter D3, <br> label diameter D [mm] |
| :--- | :--- | :--- | :--- | :--- |
| above | to: | Permissible deviation [mm] |  |  |
| 0 | 0.5 | $\pm 0.8$ | $\pm 0.4$ |  |
| 0.5 | 1.0 | $\pm 1.0$ | $\pm 0.6$ |  |
| 1.0 |  | $\pm 1.3$ | $-0.7 \mid+0.8$ |  |

The specified tolerances refer to an unfilled container.
The container diameter must be at least 45 mm . When a container diameter > 108 mm is exceeded, KRONES must be consulted to ensure processability on neck handling starwheels and rejection units.
In the area of the filling technology, the following PET container heights can be processed for all applications outside aseptic:
$\geq 150 \mathrm{~mm}$ : Minimum PET container height

## $\leq 350 \mathrm{~mm}$ : Maximum PET container height

Measured in each case from the top edge of the neck finish to the bottom edge of the container base. The span from the smallest to the largest container must not exceed a height difference of 200 mm . If the minimum or maximum container height is exceeded, then processing can be checked in individual cases with regard to the design up to the following values:

## $\leq 370 \mathrm{~mm}$ or

- $\geq 105 \mathrm{~mm}$ (for non-returnable PET in neck-handling system) or
- $\geq 140 \mathrm{~mm}$ (for returnable PET in base-handling system)

Processability is no longer ensured outside these values.

## Neck geometry and neck finish

For designing the neck guide, the beginning of the neck (dimension C ) and the neck height (dimension E) are required.

| Neck height E [mm] | Permissible deviation [mm] |
| :--- | :--- |
| $<4$ | not permissible |
| $>4$ | +0.3 |

If these tolerances are exceeded in the neck/neck finish area, consultation with KRONES is required.
When different neck finishes are used (other height, other support ledge diameter), it is necessary to check for mixed processability by KRONES. Consultation with the specialist department Engineering Department/Packaging Division is required when using clip inserters.

## Guide diameter

The container guide diameter must always be the largest diameter on the container - even when all tolerances are exhausted. The container requires a constant guide diameter.
The height of this guide diameter must be between 40 and 50 mm . At special expense, this can also be a height between 30 and 40 mm (it is sufficient when at least one contact point with the maximum container diameter is within a range of 10 mm ).
Consultation with the specialist department Engineering Department/Packaging Division is required in case of deviation from the specifications.

## Plane parallelism

Please note "Plane parallelism" in Chap. 3.1.1 Sample drawing - example [» 15]

| Diameter of neck finish recess K |  | Permissible axis deviation from the |
| :--- | :--- | :--- |
| above | to: | plane parallelism [mm] |
| - | 40 | $2 \%$ of diameter |
| 40 | 50 | 0.9 |

## Rectangularity

Please note "Rectangularity" in Chap. 3.1.1 Sample drawing - example [ 15]

| Rated volume [l] |  | Permissible deviation of |
| :--- | :--- | :--- | :--- |
| rectangularity [mm] |  |  |

## Cylindrical shape/linear shape

In the labelling area, both the cylindrical shape and the linear shape must not deviate from the ideal state of the container by more than 0.3 mm .

## Additional requirements

## Container shape and dimensional accuracy

The transportability of containers in an air conveyor or a packer is mainly dependent on the container shape, especially characterised by the shoulder angle $\omega$. The following areas are differentiated:
Fig. 17: Container types

| Shoulder angle $\omega$ [ ${ }^{\circ}$ ] |  | Transportability |
| :--- | :--- | :--- |
| above | to: |  |
| 0 | 30 | greatly limited |
| 30 | 45 | good |
| 45 | 65 | very good |
| 65 | 80 | limited |
| 80 |  | greatly limited |

Tab. 1: With regard to an air conveyor:

| Shoulder angle $\omega$ $\left[{ }^{\circ}\right]$ |  | Processability |
| :--- | :--- | :--- |
| above | to: |  |
| 0 | 30 | Special approval + test for divider inserter |
| 0 | 30 | Special approval for clip inserter |
| 80 |  | Visually defective shrink-wrapped packs |
| 80 |  | Special approval for wrap-around pack |

Tab. 2: With regard to the Variopack/Varioline packer:

## Contact: Engineering Department/Packaging Division specialist department

With shoulder angles $\omega<30^{\circ}$ or $\omega>65^{\circ}$, KRONES must be consulted.
Depending on the shoulder angle $\omega$, the neck radius Rh and the neck height E must have the following minimum values:

| Shoulder angle $\omega$ [ ${ }^{\circ}$ ] |  | Neck radius Rh [mm] | Neck height E [mm] |
| :---: | :---: | :---: | :---: |
| above | to: |  |  |
|  | 20 | not permissible |  |
| 20 | 25 | > 1.0 | > 6.0 |
| 25 | 35 | > 1.0 | > 5.0 |
| 35 |  | > 1.0 | > 4.5 |
| 35 |  | > 1.5 | > 4.0 |

## Stability

Especially for light-weight containers, sufficient stability of the empty and filled containers is important. Even if lateral forces act on the containers, they must not be strongly deformed.

## PET containers

## Thermostability

The following percentage dimensional deviations of the nominal dimensions are permissible for closed containers filled with carbonated water ( $8.0-0.5+0 \mathrm{~g} / \mathrm{l} \mathrm{CO}_{2}$ ) after 24 h storage at $38^{\circ} \mathrm{C}$ (any desired humidity).

Further processing of containers with machine stop:
Due to dimensional changes of the containers, further processing after $>30$ minutes is not possible or only with major restrictions. This applies to the entire system line. This specification does not apply to grip recesses, etc.

| Rated volume [I] |  | Height H |  | Container diameter D, <br> Label diameter DE [mm] |
| :--- | :--- | :--- | :--- | :--- |
| above | to: |  | 4.0 |  |
| 0 | 1.5 | 3.0 | 5,0 |  |
| 1.5 |  | 3,5 |  |  |

## Beads

| Dimension T1, T2, T3 | Minimum dimension |
| :--- | :--- |
| T1, T3 | 10 mm |
| T2 | 8 mm |

The beads must be designed so that two bottles cannot become interlocked with each other.

## Axial pressure load (Top Load)

The measurement of the vertical load capacity (Top Load) of the empty container up to buckling (maximum load capacity, 'peak load'). In the process, the movement speed of the piston is to be $510 \mathrm{~mm} /$ min to ensure the comparability of several measurements. The containers must bear an average load of $\mathrm{k} \times 140 \mathrm{~N}$.

Usually the container wall thickness is less if a non-carbonated product is to be filled. The top load for these applications is reduced. The containers must therefore bear an average load of $\mathrm{k} \times 90 \mathrm{~N}$, and the factor $k$ is calculated as follows:

| $\square$ Carbonated product | Top Load $=\mathrm{k} \times 140 \mathrm{~N}$ |  |
| :--- | :--- | :---: |
| $\square$ Non-carbonated product | Top Load $=\mathrm{k} \times 90 \mathrm{~N}$ |  |
| $\square$ Calculation k | $\mathrm{k}=$ | weight of sample bottle - neck finish weight |
|  |  | Preform weight according to table -6 g |

## Other requirements

- With PET containers with carbonated product, the ambient temperature must also be specified.
- With tamper-evident labels, the Labelling Technology Division must be consulted for dimensions $\mathrm{E}+$ height of neck finish $\mathrm{M}<40 \mathrm{~mm}$.
- KRONES must be provided with the geometry of a PET container before and after filling the container so that the container handling parts can be adapted accordingly.

## Factors which influence the fill level:

■ Filler type, output, bottle neck geometry, machine pitch, size of discharge and capping starwheel, carbonation or nitrogen injector, bump formation during shrinking process

- The requirements for the fill level are very heterogeneous for the various machines, i.e. the fill level must be as high as possible and as low as necessary. A balanced fill level must be ensured in the process.

## Adhesiveness

According to the "KRONES adhesiveness measurement" method, the preform/PET bottle adhesiveness must not exceed the following values:

- Preform 5 N
- Bottles 15 N

Residues on the containers may not have a negative effect on the unwinding behaviour. Sticking together of the bottles must be prevented.
Definition of adhesiveness: See preform specifications, adhesiveness supplement sheet

## Base mould

Each individual contact surface (footprint) of the container must have a diameter $\geq 6 \mathrm{~mm}$.
If the contact surface is $<6 \mathrm{~mm}$, processing in the shrinking tunnel is not possible.

Fig. 18: Contact surface condition
Definition of adhesiveness: See preform specifications, adhesiveness supplement sheet

### 3.2 Not rotationally symmetrical containers (speciallyshaped containers)

### 3.2.1 Overview matrix

The following overview shows the various specially-shaped containers schematically

Fig. 19: Container shape - square

Fig. 20: Container shape - rectangular

Fig. 22: Container shape - hexagonal

Fig. 25: Container shape - oval

Fig. 23: Container shape - octagonal

Fig. 26: Container shape - kidneyshaped

Fig. 24: Container shape - polygonal

Fig. 27: Special shape and Others

### 3.2.2 Sample drawing - example

Fig. 28: Dimensioned PET container (specially-shaped container)
// = plane parallelism
$\varnothing \mathrm{G}=$ support ledge diameter
$\varnothing \mathrm{K}=$ diameter, neck finish recess
$\varnothing$ L1 = neck diameter, beginning
$\varnothing L 2$ = neck diameter, end
$\varnothing D=$ outside container diameter
$\varnothing D=$ inside container diameter
$\mathrm{H}=$ container height
E = neck height, support ledge
$C=$ height of neck area, end
$B=$ height of labelling area
A = height of labelling area, end
$\cap=$ line shape
$M$ = height of neck finish
_ = straightness
$\perp$ = perpendicularity
T1 - T3 = beads
$S=$ neck finish recess height $R h$, radius at neck transition

Rv = Radius at cap ring
RT = Radius at support ledge

### 3.2.3 Shape/geometry and dimensional accuracy

Heights, containers and label diameter

| Rated volume [l] |  | Height (H) [mm] |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| above | to: |  | Outside container diameter D, <br> Inside container diameter N [mm] |
| 0 | 0.5 | $\pm 0.8$ | $\pm 0.4$ |
| 0.5 | 1.0 | $\pm 1.0$ | Permissible deviation [mm] |
| 1.0 |  | $\pm 1.3$ | $\pm 0.6$ |

The specified tolerances refer to an unfilled container.
The container diameter must be at least 45 mm . When a container diameter $>108 \mathrm{~mm}$ is exceeded, KRONES must be consulted to ensure processability on neck handling starwheels and rejection units. In the area of the filling technology, the following PET container heights can be processed for all applications outside aseptic:

- $\geq 150 \mathrm{~mm}$ (minimum PET container height)
- $\leq 350 \mathrm{~mm}$ (maximum PET container height)

Measured in each case from the top edge of the neck finish to the bottom edge of the container base. The span from the smallest to the largest container must no exceed a height difference of 200 mm .
If the minimum or maximum container height is exceeded, then processing can be checked in individual cases with regard to the design up to the following values:

- $\leq 370 \mathrm{~mm}$ or

■ $\geq 105 \mathrm{~mm}$ (for non-returnable PET in neck-handling system) or

- $\geq 140 \mathrm{~mm}$ (for returnable PET in base-handling system)

Processability is no longer ensured outside these values.

## Neck geometry and neck finish

For designing the neck guide, the beginning of the neck (dimension C ) and the neck height (dimension E) are required.

| Neck height $\mathrm{E}[\mathrm{mm}]$ | Permissible deviation $[\mathrm{mm}]$ |
| :--- | :--- |
| $<4$ | not permissible |
| $>4$ | +0.3 |

If these tolerances are exceeded in the neck/neck finish area, consultation with KRONES is required.
Consultation with the Engineering Department/Packaging Division specialist department is required before using clip inserters.

When different neck finishes are used (other height, other support ledge diameter), it is necessary to check for mixed processability by KRONES.

## Guide diameter

The container guide diameter must always be the largest diameter on the container - even when all tolerances are exhausted. The container requires a constant guide diameter. The height of this guide diameter must be between 40 and 50 mm . At special expense, this can also be between 30 and 40 mm . (It is sufficient when at least one contact point with the maximum container diameter is within a range of 10 mm ).

Consultation with the specialist department Engineering Department/Packaging Division is required in case of deviation from the specifications.

## Plane parallelism

Please note "Plane parallelism" in Chap. 3.2.2 Sample drawing - example [ 20]

| Diameter of neck finish recess K |  | Permissible axis deviation from the |
| :--- | :--- | :--- | :--- |
| above | to: | plane parallelism [mm] |
| - | 40 | $2 \%$ of diameter |
| 40 | 50 | 0.9 |

## Rectangularity

Please note "Rectangularity" in Chap. 3.2.2 Sample drawing - example [» 20]

|  | Rated volume [l] |  |
| :--- | :--- | :--- |
| above | to: | Permissible axis deviation of |
| rectangularity [mm] |  |  |

## Straightness/linear shape

In the labelling area, both the straightness and the linear shape must not deviate from the ideal state of the container by more than 0.3 mm .

## Additional requirements for container shape and transportability

## Container shape and dimensional accuracy

The transportability of containers in an air conveyor or packer is mainly dependent on the container shape, especially characterised by the shoulder angle $\omega$. The following areas are differentiated:
Fig. 29: Container types

| Shoulder angle $\omega$ [ ${ }^{\circ}$ ] |  | Transportability |
| :--- | :--- | :--- |
| above | to: |  |
| 0 | 30 | greatly limited |
| 30 | 45 | good |
| 45 | 65 | very good |
| 65 | 80 | limited |
| 80 |  | greatly limited |

Tab. 3: With regard to an air conveyor:

| Shoulder angle $\omega\left[{ }^{\circ}\right]$ |  | Processability |
| :--- | :--- | :--- |
| above | to: |  |
| 0 | 30 | Special approval + test for divider inserter |
| 0 | 30 | Special approval for clip inserter |
| 80 |  | Visually defective shrink-wrapped packs |
| 80 |  | Special approval for wrap-around pack |

Tab. 4: With regard to the Variopack/Varioline packer:

## Contact: Engineering Department/Packaging Division specialist department

With shoulder angles $\omega<0^{\circ}$ or $\omega>65^{\circ}$, KRONES must be consulted.
Depending on the shoulder angle $\omega$, the neck radius Rh and the neck height E must have the following minimum values:

| Shoulder angle $\omega$ [ ${ }^{\circ}$ ] |  | Neck radius Rh [mm] |  | Neck height E [mm] |
| :--- | :--- | :--- | :--- | :--- |
| above | to: |  |  |  |
|  | 20 |  | not permissible |  |
| 20 | 25 | $>1.0$ | $>6.0$ |  |
| 25 | 35 | $>1.0$ | $>5.0$ |  |
| 35 |  | $>1.0$ | $>4.5$ |  |
| 35 |  | $>1.5$ | $>4.0$ |  |

## Corner radius

For the processability of the containers in the Variopac packer, the corner radius must be designed as shown in the draft. Otherwise, please consult the Engineering Department/Packaging Division specialist department.

Fig. 30: Corner radius

## Stability

Especially for light-weight containers, sufficient stability of the empty and filled containers is important. Even if lateral forces act on the containers, they must not be strongly deformed.

## Thermostability

The following percentage dimensional deviations of the nominal dimensions are permissible for closed containers filled with carbonated water ( $8.0-0.5+0 \mathrm{~g} / \mathrm{l} \mathrm{CO}_{2}$ ) after 24 h storage at $38^{\circ} \mathrm{C}$ (any desired humidity). Further processing of containers with machine stop: Due to dimensional changes of the containers, further processing after > 30 minutes is not possible or only with major restrictions. This applies to the entire system line. This specification does not apply to grip recesses, etc.

| Rated volume [I] | Outside container diameter D, <br> Inside container diameter N |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: |
| above | to: |  | Permissible deviation [\%] |  |  |  |  |
| 0 | 1.5 | 3.0 | 4.0 |  |  |  |  |
| 1.5 |  | 3,5 | 5,0 |  |  |  |  |

## Beads

| Dimension T1, T2, T3 | Minimum dimension |
| :--- | :--- |
| T1, T3 | 10 mm |
| T2 | 8 mm |

The beads must be designed so that two bottles cannot become interlocked with each other.

## Axial pressure load (Top Load)

The measurement of the vertical load capacity (Top Load) of the empty container up to buckling (maximum load capacity, 'peak load'). In the process, the movement speed of the piston is to be $510 \mathrm{~mm} /$ min to ensure the comparability of several measurements. The containers must bear an average load of $\mathrm{k} \times 140 \mathrm{~N}$.

Usually the container wall thickness is less if a non-carbonated product is to be filled. The top load for these applications is reduced. The containers must therefore bear an average load of $k \times 90 \mathrm{~N}$, and the factor $k$ is calculated as follows:

| $\square$ Carbonated product | Top Load $=\mathrm{k} \times 140 \mathrm{~N}$ |  |
| :--- | :--- | :--- |
| $\square$ Non-carbonated product | Top Load $=\mathrm{k} \times 90 \mathrm{~N}$ |  |
| $\square$ Calculation k | $\mathrm{k}=$ | weight of sample bottle - neck finish weight |
|  |  | Preform weight according to table -6 g |

## Other requirements

- With PET containers with carbonated product, the ambient temperature must also be specified.
- With tamper-evident labels, the Labelling Technology Division must be consulted for dimensions $\mathrm{E}+$ height of neck finish $\mathrm{M}<40 \mathrm{~mm}$.
- KRONES must be provided with the geometry of a PET container before and after filling the container so that the container handling parts can be adapted accordingly.

## Factors which influence the fill level:

- Filler type, output, bottle neck geometry, machine pitch, size of discharge and capping starwheel, carbonation or nitrogen injector, bump formation during shrinking process
- The requirements for the fill level are very heterogeneous for the various machines, i.e. the fill level must be as high as possible and as low as necessary. A balanced fill level must be ensured in the process.

## Adhesiveness

According to the "KRONES adhesiveness measurement" method, the preform/PET bottle adhesiveness must not exceed the following values:

```
- Preform 5 N
```

- Bottles 15 N

Residues on the containers may not have a negative effect on the unwinding behaviour. Sticking together of the bottles must be prevented.

## Base mould

Each individual contact surface (footprint) of the container must have a diameter $\geq 6 \mathrm{~mm}$.
If the contact surface is $<6 \mathrm{~mm}$, processing in the shrinking tunnel is not possible.

Fig. 31: Contact surface condition
Definition of adhesiveness: See preform specifications, adhesiveness supplement sheet

## 4 Plastic containers (without PET)

### 4.1 Rotationally symmetrical, cylindrical containers

### 4.1.1 Sample drawing - Example 1

/= plane parallelism
$\varnothing \mathrm{L} 1=$ neck diameter, beginning
$\mathrm{H}=$ container height
$\mathrm{C}=$ height of neck area, end
X1 = handle height
X2 = height of handle through-passage area
$B=$ height of labelling area
A = height of labelling area, end
$\perp=$ perpendicularity
M = height of neck finish
$\omega^{\circ}=$ shoulder angle
$\varnothing$ D3/D4 = container diameter
$\varnothing \mathrm{D}=$ container diameter
T1 - T3 = beads

Fig. 32: Example: Plastic container (1)

### 4.1.2 Sample drawing - Example 2

Fig. 33: Example: Plastic container (2)
// = plane parallelism
$\varnothing$ L1 = neck diameter, beginning
$\varnothing L 2$ = neck diameter, end
$\varnothing D=$ container diameter
$\varnothing$ D3 = container diameter
$\varnothing$ D4 = container diameter
$\perp$ = perpendicularity
$\mathrm{H}=$ container height
E = neck height, support ledge
$\mathrm{C}=$ height of neck area, end
$B=$ height of labelling area
A = height of labelling area, end
$M=$ height of neck finish
$\omega^{\circ}=$ shoulder angle
R3-R6 = relevant container radii
$Y^{\circ}=$ base tapering angle
Rv = Radius at cap ring
RT = Radius at support ledge

### 4.1.3 Shape/geometry and dimensional accuracy

Heights, containers and label diameter

| Rated volume [l] |  | Height (H) [mm] |  | Container diameter D, D3, D4 [mm] |
| :--- | :--- | :--- | :--- | :--- |
| above | to: |  |  |  |
| 0 | 0.5 | $\pm 0.8$ | $\pm 0.4$ |  |
| 0.5 | 1.0 | $\pm 1.0$ | $\pm 0.6$ |  |
| 1.0 | 1.5 | $\pm 1.0$ | $-0.7 \mid+0.8$ |  |
| 1.5 | 2.5 | $\pm 1.3$ | $-0.7 \mid+0.8$ |  |
| 2.5 |  | $\pm 1.3$ | $-0.7 \mid+0.8$ |  |

## Neck geometry and neck finish

For designing the neck guide, the beginning of the neck (dimension C) and the neck height (dimension E) are required.

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :--- | :--- |
| Neck diameter - beginning | $Ø$ L1 | +0.2 |
| Neck diameter - end | $\emptyset$ L2 | +0.2 |

## Plane parallelism

Please note "Plane parallelism" in Chap. 4.1.1 Sample drawing - Example 1 [ 26]

| Diameter of neck finish recess K |  | Permissible axis deviation from the |  |
| :--- | :--- | :--- | :--- |
| above | to: | 40 | $2 \%$ of diameter |
| - | 50 | 0.9 |  |
| 40 |  |  |  |

## Rectangularity

Please note "Rectangularity" in Chap. 4.1.1 Sample drawing - Example 1 [> 26]

| Rated volume [l] |  | Permissible axis deviation of |
| :--- | :--- | :--- |
| above | to: | 1.5 |

## Additional requirements

## Stability

Especially for light-weight containers, sufficient stability of the empty and filled containers is important. Even if lateral forces act on the containers, they must not be strongly deformed.

## Beads

| Dimension T1, T2, T3 | Minimum dimension |
| :--- | :--- |
| T1, T3 | 10 mm |
| T2 | 8 mm |

The beads must be designed so that two bottles cannot become interlocked with each other.

## Axial pressure load (Top Load)

With regard to Top Load, the minimum value may not drop below 120 N for empty and full containers. Always contact KRONES when the Top Load is lower than the above!

## Surface condition

Residues which occur as a result of the container production process must be presented to and known at KRONES.

If the containers are not flamed, special glues are to be used. Dirt, splattered glue, etc. are also disadvantages. In addition, glue strings often occur when the machine operates at higher speeds.

Furthermore, it must be determined here with tests which glue rollers and pallets (pairing) can be used.

## Other requirements

KRONES must be provided with the geometry of a HDPE container before and after filling a container so that the container handling parts can be adapted accordingly.

### 4.2 Not rotationally symmetrical containers (speciallyshaped containers)

### 4.2.1 Overview matrix

The following overview shows the various specially-shaped containers schematically

Fig. 34: Container shape - square

Fig. 35: Container shape - rectangular

Fig. 38: Container shape - hexagonal

Fig. 41: Container shape - oval

Fig. 36: Container shape - triangular

Fig. 39: Container shape - octagonal

Fig. 42: Container shape - kidneyshaped

Fig. 43: Special shape and Others

### 4.2.2 Sample drawing - Example 1

Fig. 44: Example: Plastic container (3, specially-shaped container)
// = plane parallelism
Mv = neck finish offset to centre of container
$\varnothing$ L1 = neck diameter, beginning
$\mathrm{Ra}=$ shoulder radius - front view
$\mathrm{Rb}=$ handle radius
$\mathrm{H}=$ container height
X1 = handle height
X2 = height of handle through-passage area
$B=$ height of labelling area
A = height of labelling area, end
$\perp$ = perpendicularity
Rc = outer radius
$\mathrm{Rd}=$ inside recess radius
$M=$ height of neck finish
$\mathrm{Rf}=$ shoulder radius - side view
$\omega^{\circ}=$ shoulder angle
T2 = beads
$\mathrm{Ra}-\mathrm{Rf}=$ relevant container radii
$\varnothing$ D = relevant outside container diameter

### 4.2.3 Sample drawing - Example 2

// = plane parallelism
$\mathrm{H}=$ container height
$\mathrm{C}=$ height of neck area, end
$\mathrm{Hs}=$ shoulder height
$B=$ height of labelling area
A = height of labelling area, end
$\omega^{\circ}=$ shoulder angle
$\perp$ = perpendicularity
$\varnothing \mathrm{D}=$ outside container diameter
Da - De = relevant container lengths
$\varnothing \mathrm{K}=$ diameter, neck finish recess
$\mathrm{M}=$ height of neck finish
$\varnothing$ L1 = neck diameter, beginning
$\mathrm{T}-\mathrm{Te}=$ relevant container widths

Fig. 45: Example: Plastic container (4, specially-shaped container)

### 4.2.4 Shape/geometry and dimensional accuracy

Heights and container diameter

| Rated volume [I] |  | Height (H) [mm] |  | Outside container diameter D, <br> Inside container diameter N |
| :--- | :--- | :--- | :--- | :--- |
| above | to: |  | $\pm 0.4$ |  |
| 0 | 0.5 | $\pm 0.8$ | $\pm 1.0$ | $\pm 0.6$ |
| 0.5 | 1.0 | $\pm 1.0$ | $-0.7 \mid+0.8$ |  |
| 1.0 | 1.5 | $\pm 1.3$ | $-0.7 \mid+0.8$ |  |
| 1.5 | 2.5 | $\pm 1.3$ | $-0.7 \mid+0.8$ |  |
| 2.5 |  |  |  |  |

## Neck geometry

For designing the neck guide, the beginning of the neck (dimension C ) and the neck height (dimension E) are required.

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :--- | :--- |
| Neck diameter - beginning | $\emptyset$ L1 | +0.2 |
| Neck diameter - end | $\emptyset$ L2 | +0.2 |

## Plane parallelism

Please note "Plane parallelism" in Chap. 4.2.2 Sample drawing - Example 1 [ ${ }^{\text {[ 30] }}$

| Diameter of neck finish recess K |  | Permissible axis deviation from the |
| :--- | :--- | :--- | :--- |
| above | to: | plane parallelism [mm] |
| - | 40 | $2 \%$ of diameter |
| 40 | 50 | 0.9 |

## Rectangularity

Please note "Rectangularity" in Chap. 4.2.2 Sample drawing - Example 1 [> 30]

| Rated volume [l] |  | Permissible axis deviation of |
| :--- | :--- | :--- |
| above | to: | 1 |
| 0 |  | +2.0 |
| 1 |  | +3.0 |

## Additional requirements

## Stability

Especially for light-weight containers, sufficient stability of the empty and filled containers is important. Even if lateral forces act on the containers, they must not be strongly deformed.

## Beads

| Dimension T1, T2, T3 | Minimum dimension |
| :--- | :--- |
| T1, T3 | 10 mm |
| T2 | 8 mm |

The beads must be designed so that two bottles cannot become interlocked with each other.

## Axial pressure load (Top Load)

With regard to Top Load, the minimum value may not drop below 120 N for empty and full containers. Always contact KRONES when the Top Load is lower than the above!

## Surface condition

Residues which occur as a result of the container production process must be presented to and known at KRONES.

If the containers are not flamed, special glues are to be used. Dirt, splattered glue, etc. are also disadvantages. In addition, glue strings often occur when the machine operates at higher speeds.

Furthermore, it must be determined here with tests which glue rollers and pallets (pairing) can be used.

## Other requirements

KRONES must be provided with the geometry of a HDPE container before and after filling a container so that the container handling parts can be adapted accordingly.
If the neck finish is offset relative to the container centre ( Mv ), the offset must be indicated in mm. For this, please note dimension "Mv" in Chap. 4.2.2 Sample drawing - Example 1 [ 30].

Cans

## 5 Cans

### 5.1 Rotationally symmetrical, cylindrical containers

### 5.1.1 Sample drawing - Example 1a closed beverage containers

Fig. 46: Example: Beverage can (closed)
$\varnothing$ K = flare diameter
$\varnothing L=$ neck finish diameter
H = container height
$\mathrm{E}=$ height of neck area
$\mathrm{J}=$ flare edge height
$B=$ height of labelling area
A = height of labelling area, end
/O/ = cylindrical shape
$\varnothing D=$ container diameter
$\varnothing$ SD = footprint diameter
$\cap$ = line shape
R1 - R4 = relevant can radii

### 5.1.2 Sample drawing - Example 1b open beverage containers

$\varnothing \mathrm{K}=$ flare diameter
$\varnothing \mathrm{L}=$ neck finish diameter
$\mathrm{T}=$ flare width
$\mathrm{H}=$ container height
$\mathrm{E}=$ height of neck area
$\mathrm{J}=$ flare edge height
$B=$ height of labelling area
A = height of labelling area, end
/O/ = cylindrical shape
$\varnothing \mathrm{D}=$ container diameter
$\varnothing S D=$ footprint diameter
$\cap$ = line shape
R1 - R4 = relevant can radii

Fig. 47: Example: Beverage can (open)

### 5.1.3 Sample drawing - Example 2a closed food can

$\varnothing \mathrm{K}=$ flare diameter
$\mathrm{H}=$ container height
C = height of neck area, end
$B=$ height of labelling area
A = height of labelling area, end
/O/ = cylindrical shape
$\varnothing D=$ container diameter
$\varnothing$ SD = footprint diameter
$\cap$ = line shape

Fig. 48: Example: Food can (closed)

### 5.1.4 Sample drawing - Example 2 b closed food can

$\varnothing \mathrm{K}=$ flare diameter
$\varnothing \mathrm{L}=$ neck finish diameter H
$\mathrm{H}=$ container height
$\mathrm{E}=$ height of neck area
$B=$ height of labelling area
A = height of labelling area, end
$\mathrm{T}=$ flare width
$\mathrm{J}=$ flare edge height
$\mathrm{P}^{\circ}=$ flare angle
$\varnothing \mathrm{D}=$ container diameter
/O/ = cylindrical shape
$\varnothing$ SD = footprint diameter

### 5.1.5 Sample drawing - Example 3: Other cans

$\varnothing \mathrm{K}=$ flare diameter
$\Omega^{\circ}=$ shoulder angle
$Z=$ container height incl. closure
$\mathrm{H}=$ container height
$C=$ height of neck area, end
$B=$ height of labelling area
$A=$ height of labelling area, end
/O/ = cylindrical shape
$\varnothing \mathrm{D}=$ container diameter
$\varnothing \mathrm{F}=$ footprint diameter
$\cap$ = line shape

Fig. 50: Example: Other cans

### 5.1.6 Shape/geometry and dimensional accuracy

Height

| Rated volume [I] |  |  |  |  |  |  | Dimension | Permissible deviation [mm] |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| above | to: |  |  |  |  |  |  |  |
| 0 | 3.0 | $H$ | $\pm 0.4$ |  |  |  |  |  |

The following applies for beverage cans:
The can height must be within the following values to ensure processability in the can filler and seamer:
■ $\geq 87 \mathrm{~mm}$ : minimum can height

- $\leq 250 \mathrm{~mm}$ : maximum can height

Measured in each case from the top edge of the can rim to the bottom edge of the can base. Processability is no longer ensured outside these values. When these can height values are not reached and/or exceeded, KRONES must be consulted.

## Container and label diameter

| Rated volume [l] |  | Dimension |  |
| :--- | :--- | :---: | :---: |
| above | to: |  | Permissible deviation $[\mathrm{mm}]$ |
| 0 | 3.0 | $\varnothing \mathrm{D}$ | $\pm 0.2$ |
| Designation |  | Dimension | Permissible deviation $[\mathrm{mm}]$ |
| Footprint diameter | $\varnothing \mathrm{F}$ | $\pm 0.3$ |  |

The ovality is included in this deviation. With oval and square cross-sections, the wide side of the cross-section is used for defining the dimension limits.
The following applies for beverage cans:
The can diameter must be within the following values to ensure processability in the can filler and seamer:
$\geq 52 \mathrm{~mm}$ : minimum can diameter

- $\leq 85 \mathrm{~mm}$ : maximum can diameter

Measured in each case at the largest can diameter.
Processability is no longer ensured outside these values. When these can diameter values are not reached and/or exceeded, KRONES must be consulted.

## Neck/flare geometry

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :---: | :---: |
| Flare diameter | $\varnothing$ K | $\pm 0.3$ |
| Flare width | Compliance | $\pm 0.3$ |
| Neck height | E | $\pm 0.3$ |

## Surface condition

The surface condition of the cans must always be indicated. The following factors are necessary:

- Finish: yes (smooth or matt and/or with haptic elements)/no
- Brush-on: yes (type of brush-on)/no
- Colour
- To ensure proper inspection, the colour and the degree of gloss of the surfaces for each product tape must be uniform and consistent.
- The body area of the can must have a continuous layer of paint.

## General mechanical requirements

- The can must withstand an internal pressure of at least 6.2 bar.
- The empty can must withstand an axial force of at least 800 N .

Cans with top load values $>675 \mathrm{~N}$ and $<800 \mathrm{~N}$ are defined as lightweight cans and can be confirmed only after they have been released individually.
Cans with a top load < 675 N cannot be processed.

## Requirements for pasteurisation processes

- The customer object (can, lid, paints and internal coating) must be suitable for running through the steps necessary for the pasteurisation process without negative effects on the geometry or the contents.
$\square$ This refers, in particular, to the water properties (pH values, ingredients), disinfectants used, temperature, compressive strength (at least 6.2 bar and/or adapted to the saturation pressure of the finished product at the individually required pasteurisation temperatures), as well as the duration.
- The specifications and limits for process water specified by KRONES for the basis for the requirements. The pH value is an exception to this. In deviation from the current process water specifications, the pasteurisers for cans are usually operated with a slightly acid pH value ( $\mathrm{pH} 6-7$ ).
$\square \quad$ The head space in the can must be at least $4 \%$ of the nominal volume.
- A painted flap is urgently recommended to avoid the occurrence of well blackness.

## Other requirements

- For smooth processing, the height H and the diameter D must not exceed the tolerances during the entire filling and packaging process! (Otherwise, malfunctions including on the rinser, can inverter and other format-dependent components are to be expected.)
- If the flare diameter $K$ or the neck finish diameter $L$ > diameter $D$, separate information must be provided (if necessary, problems/damage in the empty can area and/or rising up of the cans in the full can area).
- The cans must have a corrosion resistance.
- The material type (aluminium or tin) must also be specified.
- The dimensions of the empty can including the tolerance specifications (in grammes) must also be indicated.
- The manufacturer and the manufacturer-specific type designation must also be stated.
- The type/designation of the internal coating must also be specified.

The internal coating must be suitable for the product to be filled and must not react with it in any way (e.g. foaming, oxygen reaction, air reaction, turbulences).

- The can base must have an undamaged and homogeneous paint coating over the entire base ring in order to enable sufficient sliding properties.

Partially or completely missing base paint affects the container handling and can lead to increased product loss, damage and scratches on the container and to an increased conveyor lubricant concentration/consumption.

## 6 Spotting bar geometry

Neither writing nor a relief may be applied to the container diameter of the spotting bar.

### 6.1 Side-spotting bars

### 6.1.1 Recessed side-spotting bar

For the side-spotting bar tolerances, see the following schematic. The specified dimensions are necessary to be able to design the centring spotting bar.

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :---: | :---: |
| Start of spotting bar above base | NBH | - |
| Spotting bar width | NB | +0.5 |
| Spotting bar height | NH | +0.5 |
| Spotting bar depth | NT | +0.5 |
| Spotting bar head radius | Ra | -0.3 |
| Spotting bar base radius | Rb | -0.3 |
| Outer radius | Rc | -0.3 |
| Inside recess radius | Rd | -0.3 |
| Spotting bar inclination angle | $\delta$ | $+2^{\circ}$ |
| Recess inclination angle | $\varphi$ | $+2^{\circ}$ |

The machine running direction depends on the symmetry of the side-spotting bar. The start of the spotting bar above the base (NBH) should not be less than 15 mm . With cone-shaped base contours, the angle $y$ must not exceed the value $10^{\circ}$.

Fig. 51: Dimensioned deepened (negative) side-spotting bar

### 6.1.2 Raised side-spotting bar

For the side-spotting bar tolerances, see the following schematic. The specified dimensions are necessary to be able to design the centring spotting bar.

## Spotting bar geometry

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :---: | :---: |
| Start of spotting bar above base | NBH | - |
| Spotting bar length | NL | +0.5 |
| Spotting bar width | NB | +0.5 |
| Spotting bar height | NH | +0.5 |
| Spotting bar head radius | Ra | -0.3 |
| Spotting bar base radius | Rb | -0.3 |
| Spotting bar head radius | Rc | -0.3 |
| Spotting bar base radius | Rd | -0.3 |
| Spotting bar width inclination angle | $\delta$ | $+1^{\circ}$ |
| Spotting bar length inclination angle | $\varphi$ | $+2^{\circ}$ |

Fig. 52: Dimensioned raised (positive) side-spotting bar

The start of the spotting bar above the base (NBH) should not be less than 15 mm . With cone-shaped base contours, the angle y must not exceed the value $10^{\circ}$.

### 6.2 Base spotting bars for glass containers

For the base spotting bar tolerances, see the following schematic. The specified dimensions are necessary to be able to design the centring spotting bar.

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :---: | :---: |
| Spotting bar height | NH | +0.5 |
| Exterior spotting bar width | Na | +0.5 |
| Interior spotting bar width | Ni | +0.5 |
| Exterior spotting bar radius | Ra | -0.3 |
| Spotting bar side radius | Rb | -0.3 |
| Interior spotting bar radius | Rc | -0.3 |
| Spotting bar width inclination angle | $\delta$ | $+1^{\circ}$ |

Fig. 53: Dimensioned base-spotting bar - glass container

### 6.3 Base spotting bars for plastic containers

For the base spotting bar tolerances, see the following schematic. The specified dimensions are necessary to be able to design the centring spotting bar

| Designation | Dimension | Permissible deviation [mm] |
| :--- | :---: | :---: |
| Spotting bar length | NL | +0.5 |
| Spotting bar width | NB | +0.5 |
| Spotting bar height | NH | +0.5 |
| Spotting bar eccentricity | NE | $\pm 0.2$ |
| Exterior spotting bar radius | Ra | -0.3 |
| Interior spotting bar radius | Rb | -0.3 |
| Spotting bar side radius | Rc | -0.3 |
| Spotting bar width inclination angle | $\delta$ | $+1^{\circ}$ |
| Spotting bar length inclination angle | $\varphi$ | $+2^{\circ}$ |
